International application No. PCT/BR03/00064

None of the two documents cited in the search report and dealing with centrifugal casting rotor cages of aluminum around steel laminations, both the cage and the lamination forming the rotor of an electric motor, is so near to the claimed subject-matter as the prior art mentioned in the application, paragraph bridging pages 3, 4.

The subject-matter of claim 1 departs from this nearest art at least in providing "a moveable block 12 defining the lower mold cavity 12a and being slideably mounted to the axial columns 13, in order to be axially displaced between an open mold position and a closed mold position" and "elastic means 50 seated on the basic block 11 and constantly forcing the moveable block 12 to the closed mold position".

Novelty is thus given.

An inventive step is also given since there is no pointer to the cited novel features in any available document, which novel features credibly solve the problem mentioned in the application, paragraph bridging pages 4, 5.
